Abstract. *This article analyzes the role of innovative technologies in the management and development of spiritual processes and their socio-philosophical foundations. The influence of information and communication technologies on the spiritual life of society, their potential in the development of spiritual values, and the philosophical aspects of the formation of digital culture are scientifically examined. In addition, the prospects for effectively organizing spiritual and educational activities through innovative technologies are also considered.*

Keywords: *spirituality, innovative technologies, spiritual processes, information society, digital culture, social philosophy, spiritual development.*

Introduction. In the 21st century, the rapid development of science and technology, particularly information and communication technologies, has significantly influenced all spheres of social life. These transformations have not only affected economic and political systems but have also profoundly reshaped cultural and spiritual processes within society. In the context of globalization and the formation of the information society, innovative technologies are becoming an important tool for managing and developing spiritual life.

Today, digital technologies, internet platforms, multimedia systems, and social networks create new opportunities for the dissemination of spiritual values, cultural heritage, and educational ideas. At the same time, they also require a new philosophical understanding of the mechanisms through which spiritual processes are organized, regulated, and transformed. The integration of innovative technologies into spiritual and educational activities allows for the modernization of traditional approaches to cultural communication and moral education.

From a socio-philosophical perspective, the management of spiritual processes through innovative technologies reflects the interaction between technological progress and human values. This interaction forms a new environment where digital culture, information ethics, and spiritual development become interconnected components of modern social life. Therefore, studying the philosophical foundations of innovative technologies in the management and development of spiritual processes is of great theoretical and practical importance.

The purpose of this article is to analyze the role of innovative technologies in managing spiritual processes and to reveal their philosophical foundations in the context of contemporary social development.

This research is based on socio-philosophical approaches to the study of spiritual processes and their transformation under the influence of innovative technologies. In order to reveal the philosophical foundations of managing and developing spiritual processes in the context of modern technological development, several scientific research methods were applied.

First, the systematic analysis method was used to examine the relationship between spiritual development and innovative technologies as an interconnected social phenomenon. This method made it possible to analyze spiritual processes not as isolated elements but as components of a complex socio-cultural system influenced by technological progress.

Second, the historical and logical approach was applied to identify the evolution of spiritual development and its transformation in the conditions of the information society. Through this method, the changes in spiritual communication, cultural transmission, and educational practices were analyzed from both historical and theoretical perspectives.

In addition, the comparative (comparativistic) method was used to study different scientific views and theoretical approaches related to the role of digital technologies in shaping spiritual culture. This method allowed for identifying similarities and differences between traditional forms of spiritual education and modern digital practices.

The research also employed general scientific methods such as analysis and synthesis, induction and deduction, which helped to generalize theoretical ideas about the role of innovative technologies in spiritual development and to formulate scientific conclusions regarding their philosophical significance.

The application of these methodological approaches ensured a comprehensive understanding of the interaction between technological innovation and spiritual development, and allowed the study to reveal the philosophical foundations of managing spiritual processes in the modern digital era.

The issue of managing and developing spiritual processes in the context of technological progress has been widely discussed in both national and international scientific literature. Scholars have analyzed the interaction between spirituality, culture, and technological development from philosophical, sociological, and cultural perspectives.

The works of the First President of the Republic of Uzbekistan, **I.A. Karimov**, are of particular importance in understanding the role of spirituality in social development. In his book *“High Spirituality – An Invincible Force,”* spirituality is interpreted as a fundamental factor of national development, social stability, and the formation of moral values among younger generations.

The author emphasizes that strengthening spiritual culture is a key condition for ensuring sustainable social progress.

Significant attention to the development of spiritual life in modern society can also be found in the works of the President of Uzbekistan **Sh.M. Mirziyoyev**. In his concept of the “**New Uzbekistan Development Strategy**,” the modernization of spiritual and educational activities, the promotion of national values, and the effective use of modern technologies in educational and cultural spheres are defined as important priorities of state policy.

Among Uzbek scholars, **O. Abilov, B. To‘rayev, I. Saifnazarov, and S. Atamuratov** have conducted research on the philosophical foundations of spirituality, the influence of globalization on national culture, and the formation of spiritual immunity in the information age. Their works emphasize the importance of integrating modern technologies with traditional spiritual values to ensure balanced social development.

Foreign researchers have also made significant contributions to the study of information society and cultural transformation. In particular, **Manuel Castells** in his concept of the *network society* analyzes how digital communication technologies reshape social and cultural interactions. **Jürgen Habermas** explores the role of communicative rationality and public discourse in shaping modern social consciousness, while **Niklas Luhmann** examines communication systems and their role in the functioning of social structures.

Overall, the existing literature demonstrates that innovative technologies play an increasingly significant role in shaping and managing spiritual processes. However, further research is required to explore the philosophical foundations of integrating digital technologies with spiritual and cultural development in contemporary society.

CONCLUSIONS AND SUGGESTIONS. In conclusion, the study demonstrates that innovative technologies play an increasingly significant role in the management and development of spiritual processes in contemporary

society. The rapid growth of information and communication technologies has created new opportunities for the dissemination of spiritual values, cultural heritage, and educational ideas, thereby contributing to the modernization of spiritual life.

From a socio-philosophical perspective, the integration of innovative technologies into spiritual and educational activities reflects the dynamic interaction between technological progress and human values. Digital platforms, multimedia resources, and online communication tools not only expand access to knowledge but also facilitate the formation of digital culture and the strengthening of spiritual awareness in society.

At the same time, the analysis indicates that the effective use of innovative technologies in managing spiritual processes requires a balanced approach. It is important to ensure that technological advancement supports the preservation and development of national spiritual values, cultural identity, and moral principles. In this context, the development of information culture, critical thinking, and spiritual immunity among younger generations becomes particularly important.

Therefore, the modernization of spiritual processes through innovative technologies should be based on solid philosophical foundations that harmonize technological innovation with the ethical and cultural values of society. The effective application of such technologies can significantly contribute to strengthening spiritual development, improving educational activities, and ensuring the sustainable progress of modern society.
